## 2CC3000 – Optimization

---

**Instructors:** Jean-Christophe Pesquet

**Department:** DÉPARTEMENT MATHÉMATIQUES

**Language of instruction:** FRANCAIS, ANGLAIS

**Campus:** CAMPUS DE METZ, CAMPUS DE RENNES, CAMPUS DE PARIS - SACLAY

**Workload (HEE):** 60

**On-site hours (HPE):** 36,00

---

### Description

This course will explore various fundamental notions of both continuous and discrete optimization.

The following topics will be addressed and implemented: formulation of optimization problems, existence conditions for global and local minimizers, convexity, duality, Lagrange multipliers, first-order methods, linear programming, integer linear programming, branch and bound approaches, preliminary stochastic optimization concepts.

### Quarter number

ST7

### Prerequisites (in terms of CS courses)

Basics in functional analysis, differential calculus, and probability (convergence, integration and probability course), knowledge of a programming environment

### Syllabus

#### 1. Optimization basics

- 1.1 Introductory notions
- 1.2 Existence of minimizers
- 1.3 Convexity
- 1.4 Duality

#### 2. Linear programming

#### 3. Integer linear programming

#### 4. More advanced notions in continuous optimization

4.1 Lagrange multipliers method

4.2 Some iterative algorithms

#### 5. Stochastic Optimization

##### **Class components (lecture, labs, etc.)**

This course combines lectures and exercise/practical classes.

This represents 22,5 hours of lectures, 10.5 of exercise classes, and 1.5 hour of final exam.

##### **Grading**

The grading will be based on a continuous evaluation process and the final written exam. In case of a justified absence to intermediary examinations, the grades of the latters are replaced by the grade of the final examination.

##### **Course support, bibliography**

D. P. Bertsekas, Nonlinear Programming, 3rd Edition. Athena Scientific, 2016. ISBN:978-1-886529-05-2

H.H. Bauschke and P. L. Combettes, Convex Analysis and Monotone Operator Theory in Hilbert Spaces, 2nd Edition. Springer, 2017. ISBN: 978-3-319-48311-5

##### **Resources**

Software equired: MATLAB, Python,...

##### **Learning outcomes covered on the course**

Upon completion of this course, the students will be able to :  
address a wide range of concrete optimization problems arising either in a scientific or industrial context.

Formulate the problem in a suitable manner, to handle it numerically by using existing methods,  
validate and interpret the solution with regards to the initial problem.

##### **Description of the skills acquired at the end of the course**

Intermediary level skills in optimization
